## PARTICULATES FROM INDUSTRY

Rob Kinnersley  
Evidence Directorate  
Environment Agency

Environment Agency

## Who is involved in Industrial Particle Regulation?

```

    graph TD
      EU[EU (AQ Directives, LCPD, ECD, HD)] --> DEFRA[DEFRA]
      DEFRA --> EA[EA, SEPA, NIEA  
(environmental agencies)]
      DEFRA --> LA[Local Authorities]
      DEFRA --> NE[NE, SNH, CCW  
(conservation agencies)]
    
```

Environment Agency

## Who is involved in Industrial Regulation?

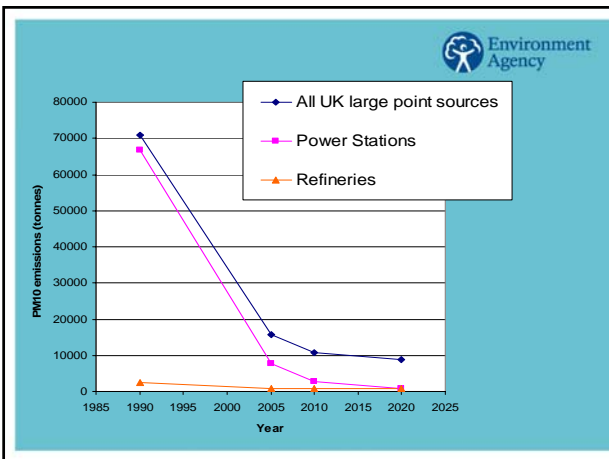

Environment Agency, SEPA, NIEA

- Large and complex industry
- Waste
- Intensive Agriculture
- Food Processing
- AQ in Major Incidents
- Statutory consultee for AQS
- Consultee for Local Authority action plans
- Pollution Inventory
- Report on State of the Environment
- NOT transport or smaller industry

Environment Agency

## The Good News

- Large reductions in particle emissions from regulated plant (with respect to baseline year of 1990)
- AQ Objectives for PM<sub>10</sub> now met at most background sites in the UK
- Average PM<sub>10</sub> and PM<sub>2.5</sub> concentrations in the UK would have been **3 µg m<sup>-3</sup>** higher in 2005 without industrial emission regulations
- 997 fewer dbf in 2005
- 1052 fewer hospital respiratory admissions in 2005
- 1055 fewer hospital cardiovascular admissions in 2005
- Loss of ~1 000 000 life years prevented for population alive in 2005

Environment Agency

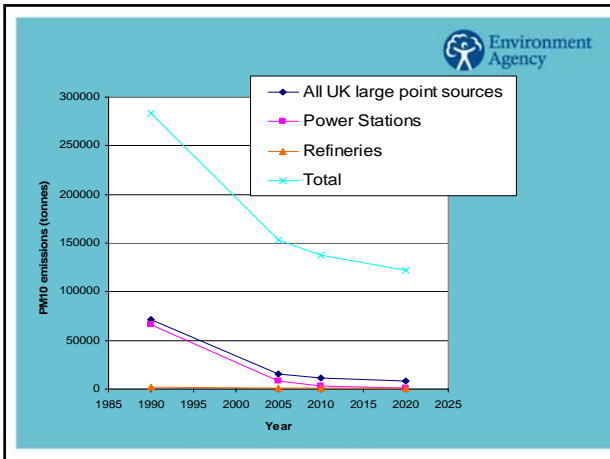

## The Good News

The trend in PM<sub>10</sub> has been, and continues to be, downwards

UK emissions (Ktonnes)	PM <sub>10</sub> (regulated)	PM <sub>10</sub> (counter-factual)
1990	283.8	
2005	153.1	182.7
2010	137.5	141.1
2020	122.4	125.1

Air quality and deposition benefits from Environment Agency regulation.  
SC060108 November 2008

# Particulates From Industry

**But...**

- local impacts can be highly significant
  - Small number of sites still experiencing exceedences to which industrial processes contribute
  - Some Habitats Directive-protected sites kept from achieving favourable status by industrial process contributions

Number (%) of UK 1km x 1km grid squares exceeding Critical Load for ...

	Acid deposition	Nutrient nitrogen deposition
1990	86,830 (46%)	123,313 (64%)
2005	56,585 (31%)	108,919 (57%)

**But...**

- local impacts can be highly significant
- “easy wins” already achieved
- subsequent reductions ever-costlier to achieve
- robust evidence needed as to benefits of further regulatory measures and contributors to problems
- some old challenges remaining, new challenges arising

**The Challenges**

- Speciation

Not all particles are equal in terms of...

- Impact on ecosystem health
- Impact on human health
  - oxidative stress potential
  - carcinogenicity
  - toxicity
- Impact on climate
  - reflection / absorption
  - hygroscopic / non-hygroscopic

Environment Agency

## Secondary aerosols

**Policy-makers need models**  
to target precursors, resolve non-linearities and co- or dis-benefits

For these we need to identify

- . Inputs and outputs
- . Model scenarios (e.g.2050)
- . Required resolutions
- . Validation
- . Variability
  - . Fluctuations
  - . uncertainties

Environment Agency

## Competing pressures

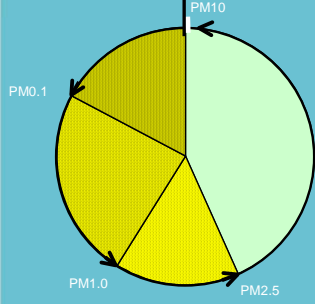

**Air Quality**  
*versus* **Climate Change**  
*versus* **socio-economics**

Environment Agency

## The Challenges

- Speciation
- Size

Environment Agency

Epidemiology currently based on PM<sub>10</sub>  
PM<sub>10</sub> includes impact of smaller fractions

Environment Agency

## The New Frontier: PM<sub>2.5</sub>

- limit and dose-reduction targets in place
- emissions now being recorded in Pollution Inventory
- questions arising include:
  - relationship between in-stack measurements and resulting ambient contribution
  - ratio of PM<sub>2.5</sub> to PM<sub>10</sub> for various sources

Environment Agency

## Ultrafine particles (<100nm)

- . growth of nanotechnology industries is likely to lead to production of new particle classes, which may also exhibit new properties.
- . materials in ultrafine form can exhibit chemical and physical properties that are significantly different than those of the bulk material.
- . vastly greater surface area presented as a material is more finely divided.
- . relatively easy to trap by filtration
- . joint NERC – EA research programme

# Particulates From Industry

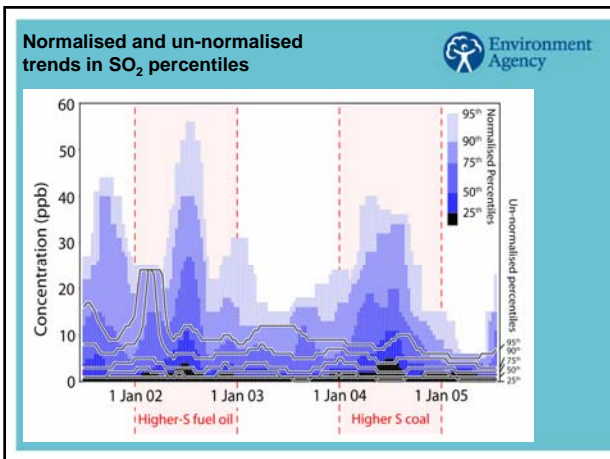

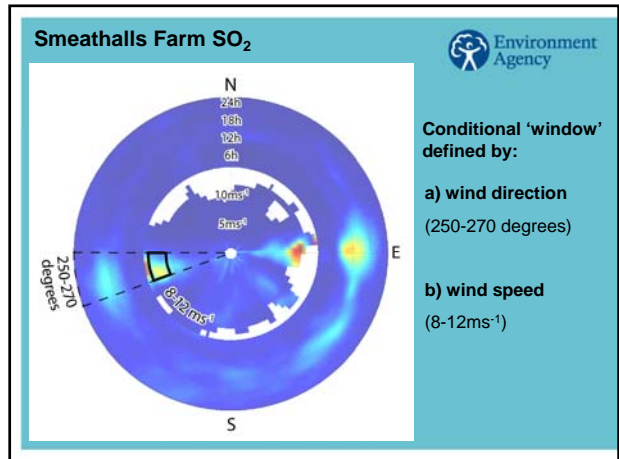

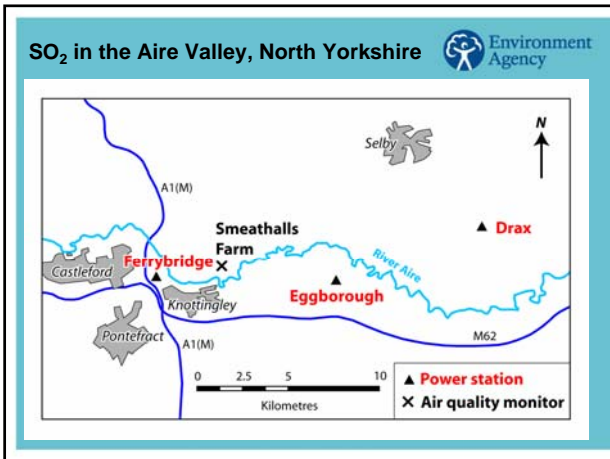

## The Challenges

- Speciation
- Size
- Source apportionment

**Where** are the particles coming from?  
**Who** needs to clean up their act (and who doesn't?)

- **modelling**
  - detailed programme of work on CMAQ
- **monitoring**
  - smarter use of few sites

**Where** are the particles coming from?  
**Who** needs to clean up their act (and who doesn't?)

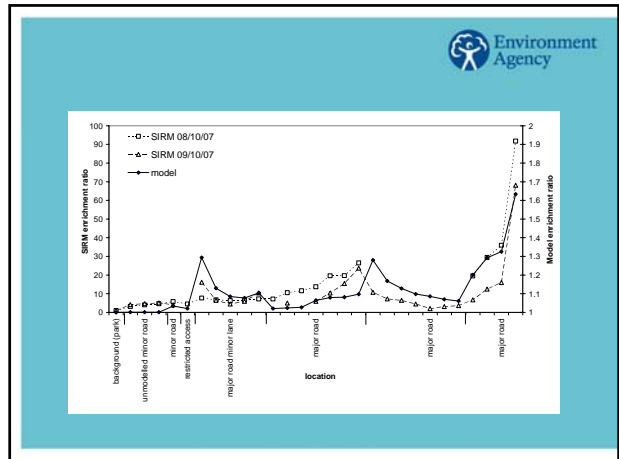

- **modelling**
  - detailed programme of work on CMAQ
- **monitoring**
  - smarter use of few sites
  - use of many more sites

# Particulates From Industry

**More monitoring points means more monitors**

- distributed sensor networks
- surrogates
  - biomonitors
  - magnetic residue analysis

**The Challenges**

- Speciation
- Size
- Source apportionment
- Bioaerosols

**Diversion of green waste from landfill**

- rapid growth in bio waste facilities
- public concern re bioaerosols (allergens, micro-organisms)
- 250m trigger distance under close scrutiny
- rapid PCR test developed as monitoring tool
- sampling protocol development
- source term analysis
- reviews of health impact studies

**Conclusions**

- Particles from industry declining nationally
- Still significant local impacts
- Further decrease requires smarter targeting of causes
- Hot topics include
  - Source apportionment
  - Role of particle composition, physical form
  - Bioaerosols

We cannot pretend to offer proofs. Proof is an idol before whom the pure mathematician tortures himself. In physics we are generally content to sacrifice before the lesser shrine of Plausibility.

Sir Arthur Eddington
